

THE HIGH BANK

Tyumen was founded in 1586 on the steep southern bank of the Tura, and left the low northern bank alone. **Four hundred and forty years later the river tested that decision — and found its limit.**

NORTH BANK	SOUTH BANK	A THRESHOLD, NOT A BOUNDARY
low terrace · the side nobody fortified	the 1586 bluff · historic centre	
Area flooded	Area flooded	The south bank holds six times more buildings — yet forty times smaller a share of them went under. Two banks of one river, four hundred metres apart, and the sixteenth-century choice still sorts the risk.
Buildings flooded	Buildings flooded	But the north-bank “ second tier ”, built above the floodplain and never flooded in living memory, went under too — a record flood crossed a line that ordinary floods never reach. The 1586 logic is not a wall between a wet bank and a dry one. It is a gradient of exposure , and July 2026 found its height.
